

Object Oriented Programming 2

Lab Assignment-2

(Separation of the interface from implementation Constructors)

Program 1.

The class **Person**

Person
-Name:string -Age: int
+Display() <constructor>+Person() <constructor>+Person(a :int)

Create object in the main and do the necessary operations.

Program 2.

Construct a class to hold personnel records class name is **Records**.

Use the following data members, and keep them **private**:

string name;

float salary;

string date_of_birth;

- Create two constructors, default and parameterized.
- Create member functions to alter the individual's name, salary, and date of birth(Set and Get functions).
- Create two objects use one object to refer member function through pointer and other object will be accessing through dot operator.

Program 3.

Write C++ header file Triangle.h with class Triangle with data members and member functions as per following class diagram. In Triangle.h file only implement get and set methods.

Triangle
-Height:double -Base:double
<<constructor>>+Triangle(double,double) + getHeight():double + setHeight(double) + getBase():double + setBase(double) + getArea():double + getPerimeter():double

Special Note : In class diagram + for public, - for private

Write C++ program to include header file Triangle.h in your program. Implement constructor(with default value for height and width will be 0), getArea() and getPerimeter member functions of Class Triangle and write menu driven program to get Height and Width details , display measurement (Area and Perimeter)of Triangle object , create new object of class Triangle.
