

Object Oriented Programming 2

Lab Assignment-5

(Binary Operator Overloading)

1) Create a class **Rectangle**.

Private members of class **Rectangle**:

Length, breadth.

Create Member function:

Public:

double getArea ()

void setLenght (double)

void setBreadth (double)

Declare overloading function use (+) operator to add two Rectangle objects.

In the main () function set rectangle length, breadth with member functions and use area function to print area of each rectangle.

Then declare a third object use overloading function to get area of third object.

2) Create a class **Distance**.

Private members of class **Distance**:

Kilometer, meter.

Create default constructor and parameter constructor.

Create Member function:

Void showDistance()

Declare overloading function use (==) operator to compare two distances.

In the main ()function set Distance kilometer, meter and use show distance to print of each distance. Then use overloading function to get difference of two distances.
