

# Object Oriented Programming 2

## Lab Assignment-4

### (Operator Overloading)

#### Program 1

Define a class DayTime:

private:

int hour, minute, second;

public:

- parameterized constructor to initialize value
- int getHour() const { return hour; }
- int getMinute() const { return minute; }
- int getSecond() const { return second; }
- int asSeconds() const // Daytime in seconds
- overload increment operator to increment the value of seconds.
- Overload decrement operator to decrement the value of minutes.

Write a menu driven program and create following menu options

1. To Display Time.
2. To Display Time in Seconds.
3. To Increment seconds.
4. To decrements minutes.
0. To exit.

#### Program 2.

Define a class **Dollar**

private:

float currency, mktrate, offrate

public:

- float getDollar() { return currency in dollar }
- float getMarketSoums() { return currency in soums }

- `float getofficialSoums() { return currency in soums }`
- `void setRates() { // input current date market and official rates }`
- overload operator “<<” to print the details of a Dollar

Inside main declare one object and show the results.
