

Step 1: Company Background (100–150 words)

GM Uzbekistan, now officially known as UzAuto Motors, is the largest automotive manufacturing company in Uzbekistan. It was established in 2008 as a joint venture between General Motors (USA) and UzAvtosanoat (Uzbekistan). After 2019, the company became fully Uzbek-owned. The company is based in Asaka, Andijan region, and produces vehicles under the Chevrolet brand. It serves both the local market and exports to neighboring countries. The company plays an important role in the national economy and employs thousands of workers. UzAuto Motors is known for its production of affordable, compact cars suitable for the domestic market. Despite being successful, the company faces challenges in adapting to changing consumer expectations, technology, and international competition.

Step 2: Environmental Analysis (PESTLE + SWOT Table) (300–350 words)

PESTLE Factor	Impact on the Company	Related SWOT Element	Comment / Explanation
Political	State ownership helps with stability but may limit business flexibility	Strength / Weakness	Support from the government ensures steady growth but slows decision-making.
Economic	Inflation and currency issues impact car prices and production costs	Threat	Higher costs can reduce affordability for customers.
Social	Growing demand for personal vehicles among middle-class families	Opportunity	Rising population and urbanization drive car demand.
Technological	Global shift to electric vehicles and smart technologies	Weakness / Opportunity	Company is slow to adopt new auto technologies compared to global brands.
Legal	Strict local certification and compliance laws for vehicle safety	Threat	Slows the launch of new models and increases cost of compliance.
Environmental	Government pressure to reduce emissions and pollution	Weakness	Lack of electric/hybrid car production affects sustainability goals.

Step 3: Performance or Opportunity Gap Statement (150–200 words)

UzAuto Motors currently faces both a **performance gap** and an **opportunity gap**. While the company remains the top automotive producer in Uzbekistan, it is struggling to meet modern global standards, especially in terms of electric vehicle (EV) production and technology upgrades. This is a performance gap because current models are outdated and lack innovation compared to international competitors. Additionally, there is an **opportunity gap** because the company has not fully entered the growing EV market or invested enough in smart features, which are becoming more popular in the region. Without addressing these gaps, UzAuto Motors risks falling behind in customer expectations and international competitiveness.

Step 4: Analyze the 4 Components of the Congruence Model (400–500 words)

Work:

The main tasks involve car assembly, quality checks, distribution, and customer service. These tasks are clearly defined and performed efficiently. However, some tasks related to innovation and design are still centralized and slow. There is also little integration with technology partners for smart systems and eco-friendly features.

People:

The company employs a large number of skilled workers and engineers. Most employees are experienced in traditional car production. However, few have training in modern automotive technology (like electric engines or digital systems). Employee motivation is stable due to job security but limited career growth opportunities reduce innovation and performance.

Structure:

The company follows a top-down hierarchy. Decision-making is centralized, and departments have clearly defined roles. While this helps control processes, it reduces flexibility and fast innovation. Teams often work in silos, and cross-department collaboration is limited.

Culture:

The organization has a formal and production-focused culture. Efficiency and meeting quotas are highly valued. However, innovation, experimentation, and risk-taking are not encouraged. Employees tend to follow orders rather than propose new ideas. This limits the ability of the company to evolve quickly with market changes.

Step 5: Identify Misalignments (250–300 words)

1. **People–Work Misalignment:** Employees are well-trained for traditional car production but lack the skills needed for smart technology and electric vehicles. Tasks require digital knowledge, but most workers are not trained in this area.
2. **Structure–Culture Misalignment:** The formal, top-down structure limits open communication and teamwork, which is necessary for modern, flexible manufacturing. The culture does not support employee voice or innovation, leading to slow problem-solving and limited adaptation to market trends.

These misalignments matter because they prevent the company from developing new, competitive products and reducing production inefficiencies. Without change, UzAuto Motors may lose local market leadership and miss export opportunities in more innovative markets.

Step 6: Suggest an Action Plan (350–400 words)

Solution 1: Employee Upskilling Program in EV and Digital Systems

The company should launch internal training sessions and certification programs in collaboration with technology partners to teach engineers and workers about electric vehicle systems and smart automotive technologies.

Why it helps: This solution addresses the **people–work** misalignment by improving employee skills to match the changing nature of automotive tasks.

Theory connection: Based on **Herzberg's Two-Factor Theory**, providing professional development increases motivation and job satisfaction.

Solution 2: ... Solution 3: ...
